

Data Migration and Conversion From Existing Systems

I. JMK does what others will not or cannot do.

We are happy to take on the challenge of helping you keep your company's data intact when moving to a new computer system.

II. Extensive experience with data export, capture, transfer and conversion from one computer system to another.

Every business has data that is specific to their company on a computer system. That data has real value and should not be abandoned. Every customer that has changed to the JMK system from another system, has had their data migrated with them.

III. Multiple time proven methods to migrate data between computer systems

A. Export

Many (not all) systems allow for the export of data. This is the simplest of all data migration solutions.

B. Capture

Data can be captured, by a variety of methods, for those systems that do not allow for data export, or those that only export a portion of their data.

C. Transfer

After export or capture data must be transfer to the new system. JMK has extensive experience in a variety of transfer methods.

D. Convert and Import

This is the hard part, where the data must be interpreted, converted and finally imported into the new system. JMK has been performing this process successfully for over 20 years with many different systems.
